

Risk assessment approaches for log exports

S. Pawson, C. Romo, N. Meurisse, M. Bader, E. Brockerhoff

O. Woodberry and A. Nicholson

Key funding agencies

- Stakeholders in Methyl Bromide Reduction – Ian Gear (Funding \$550K p.a.)
- Ministry for Business, Innovation, and Employment (\$1.3 m p.a.)
- Scion (Core funding \$210k p.a.)

Collaborators

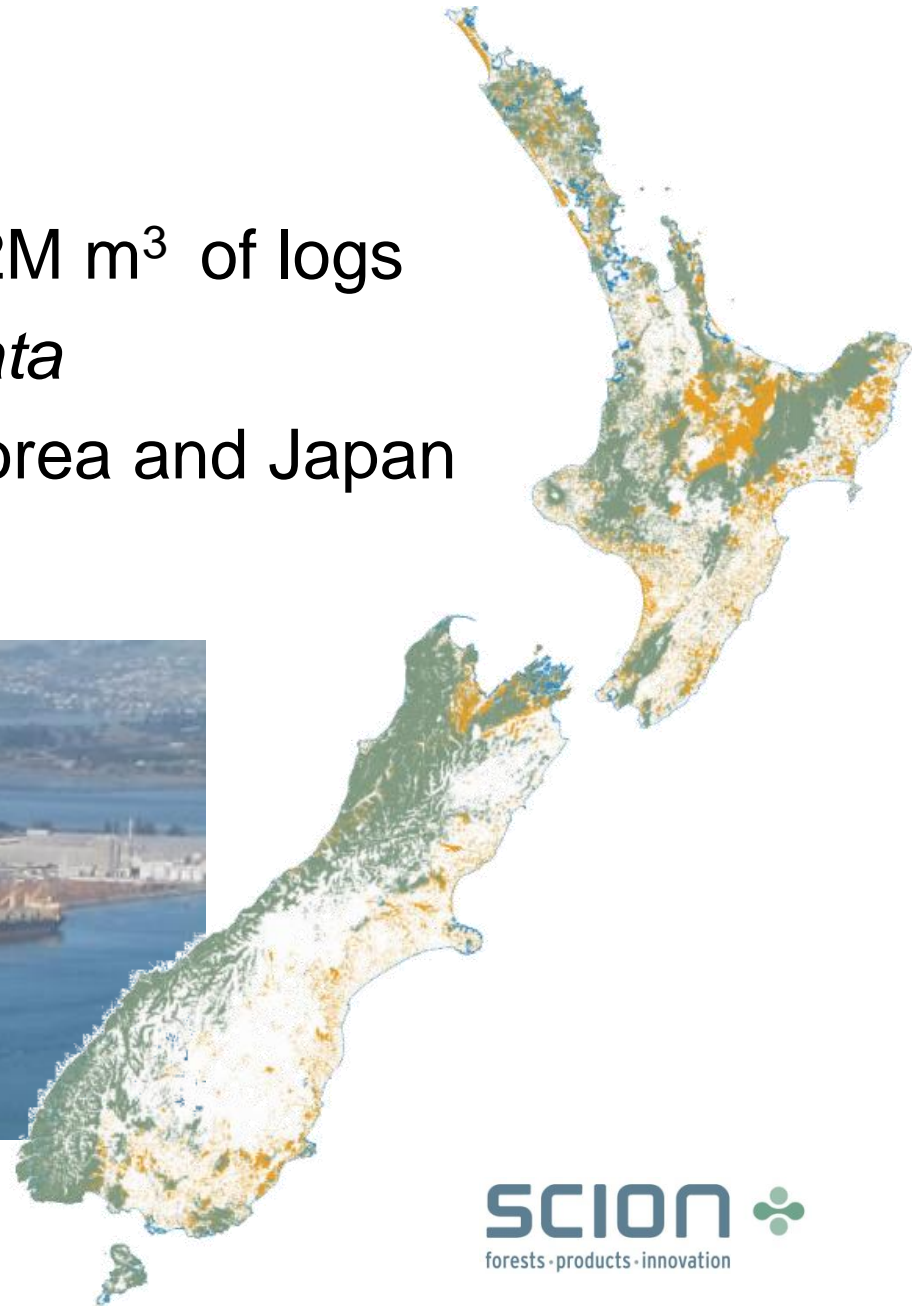

- Plant and Food Research – Don Brash
- University of Canterbury – EPECentre
- Bayesian Intelligence – Ann Nicholson/Owen Woodberry

Acknowledgements

- Forest Owners Association – Glen Mackie
- Ministry for Primary Industries – Ivan Velkovic

What is the situation?

- New Zealand exports > 12M m³ of logs
- Predominantly *Pinus radiata*
- Largely to China, India, Korea and Japan

What is the problem?

- Four key high risk phytosanitary pests in NZ.

*Arhopalus
ferus*

B

*Prionoplus
reticularis*

*Hylastes
ater*

D

*Hylurgus
ligniperda*

Sirex noctilio is considered a low risk pest, however it is of concern to trading partners.

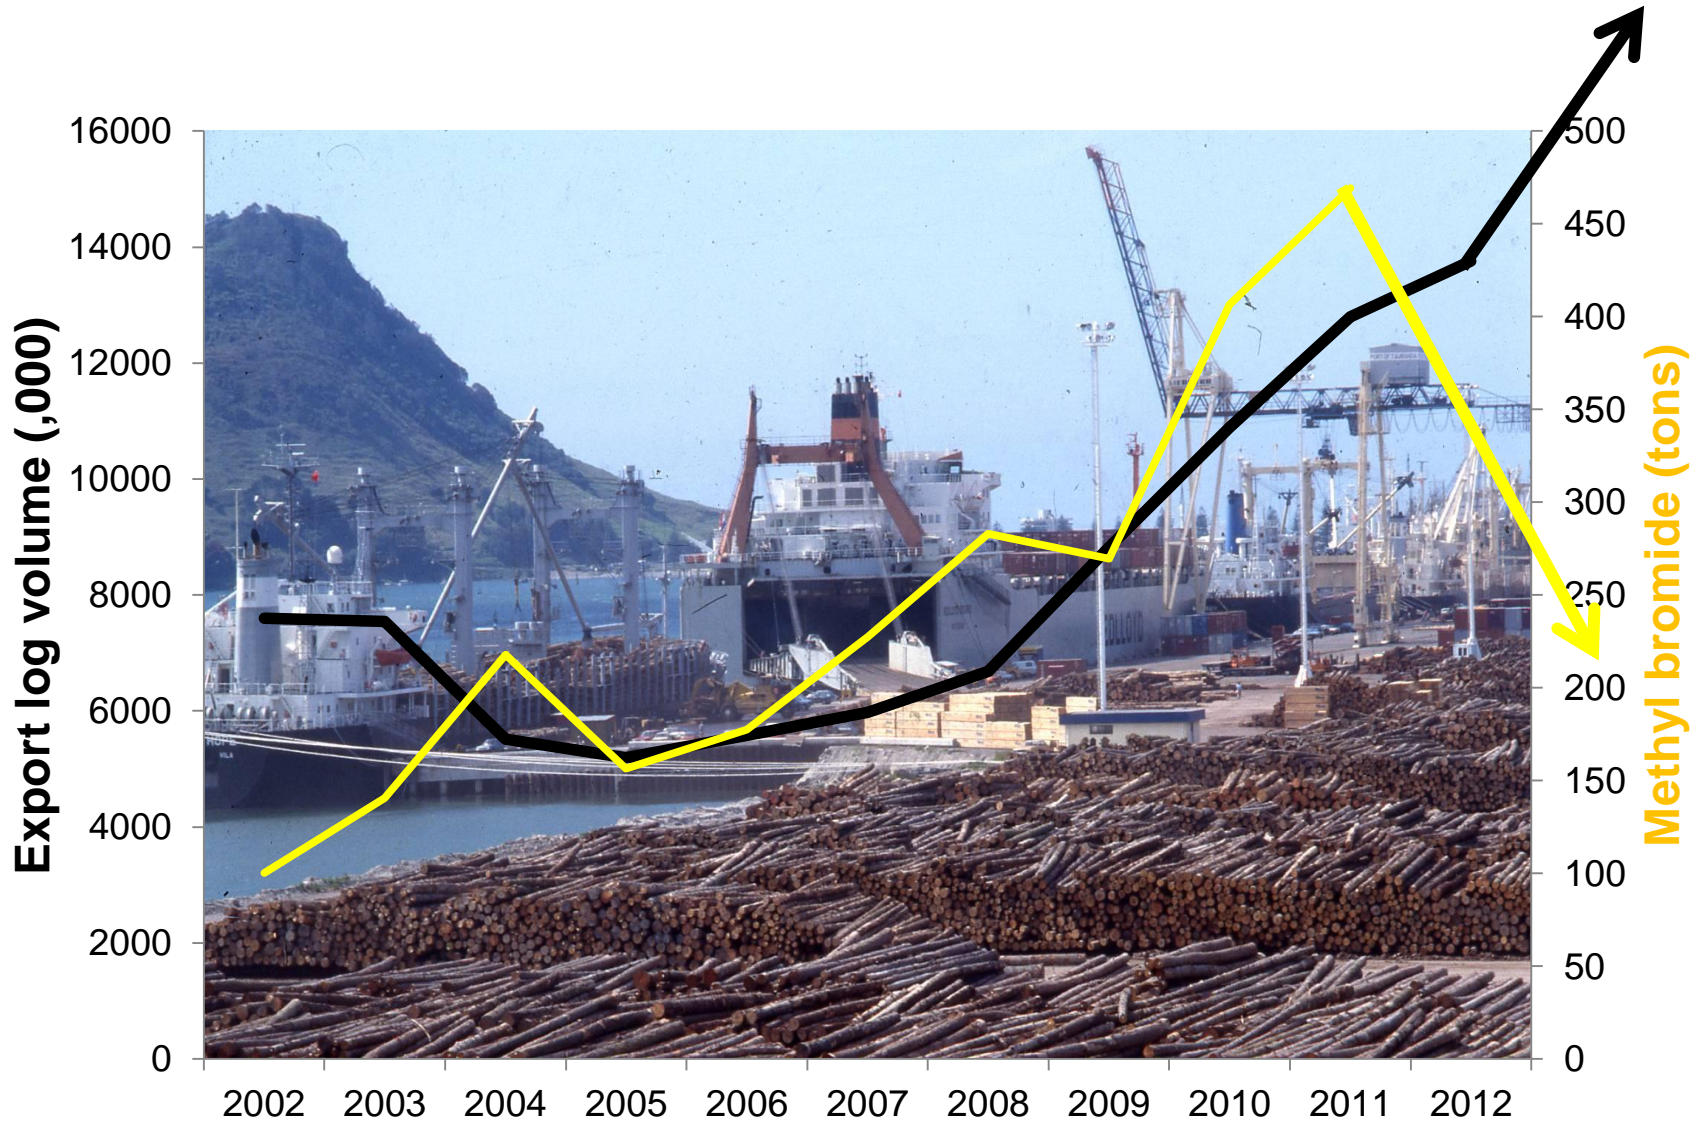

How do we currently mitigate the risk?

- Our trading partners require us to treat logs prior to export:
 - Methyl bromide is an accepted treatment
 - Debarking and heat are accepted in some markets, but current methods are not cost effective.
 - Phosphine is allowed for the Chinese market under an experimental use permit.

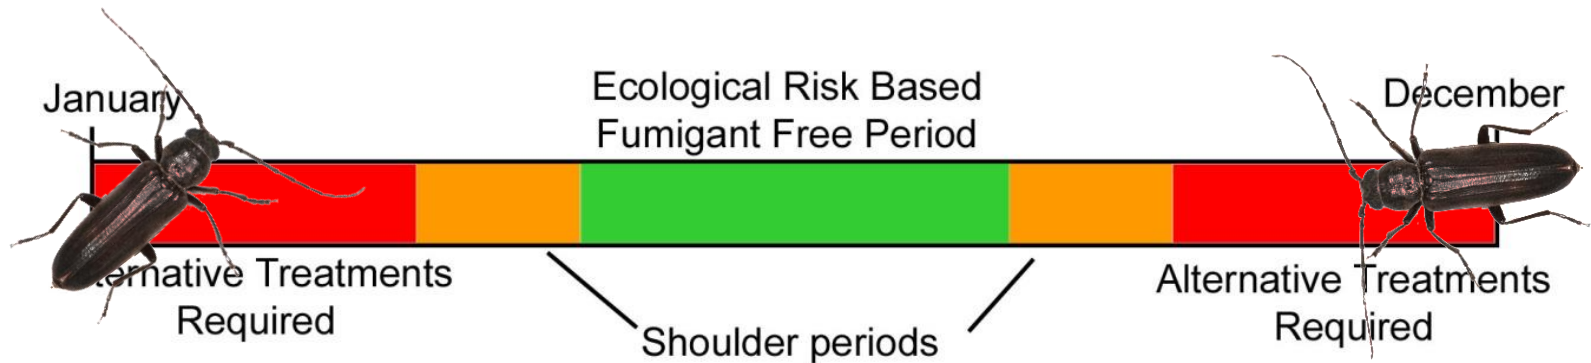

How to reverse the trend in MeBr use?

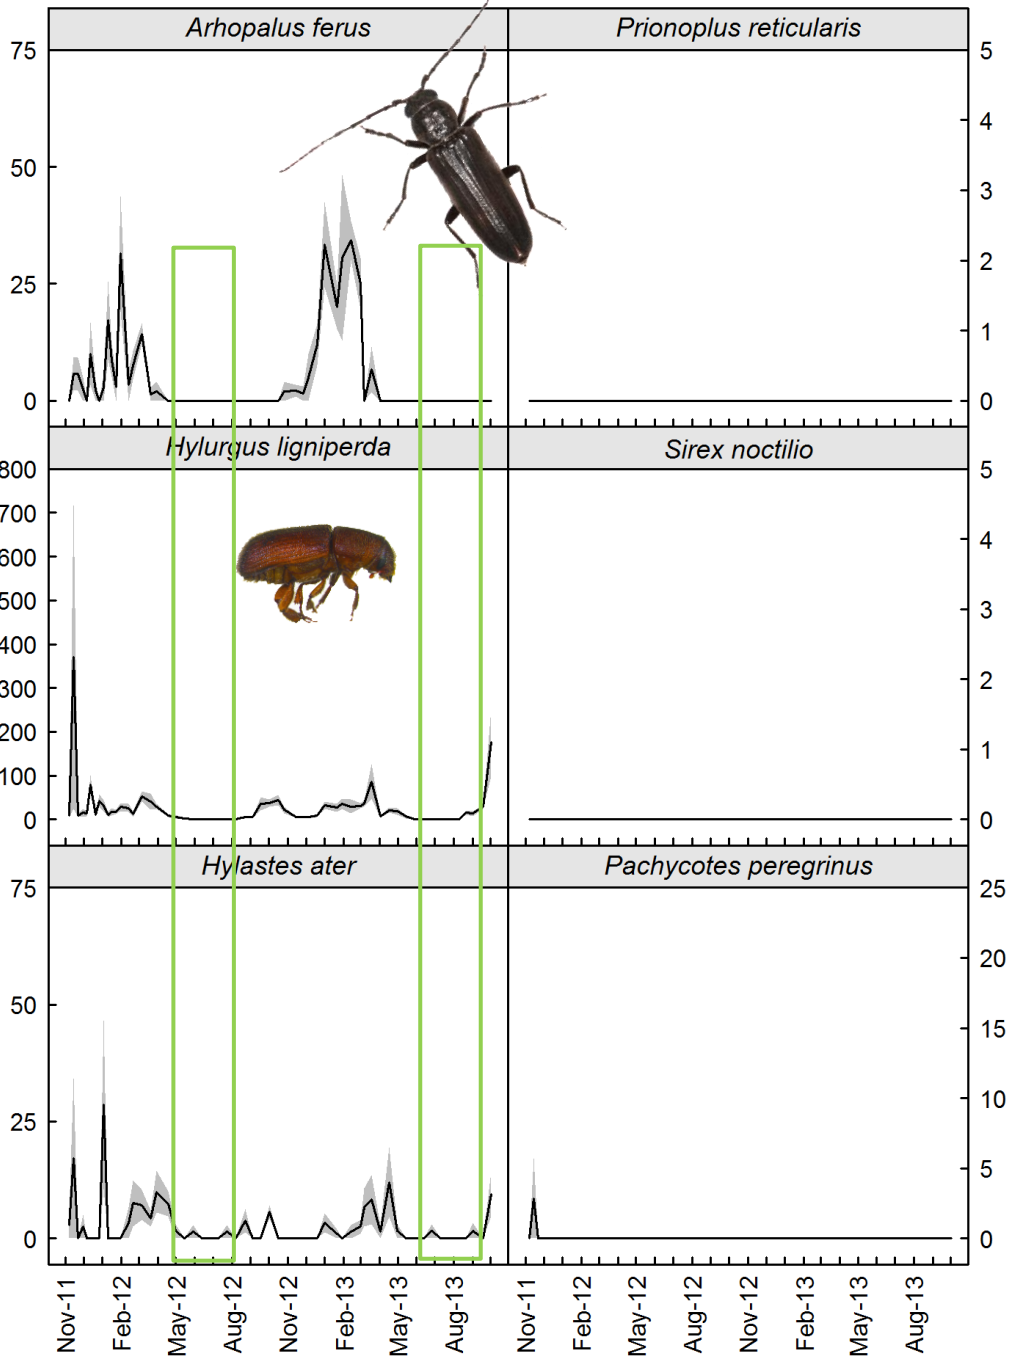

Our proposed new paradigm

Only treat commodities when a phytosanitary risk is present

Integrated Phytosanitary Pest Management

Mean catch per 100 trap days

Mean catch per 100 trap days

Integrated Phytosanitary Pest Management (IPPM)

Thermal development models

Pest Pressure at a given time and at a given place, e.g., Harvest area

Reduce reinfestation

Probability of infestation
Do we treat – fumigate or heat etc

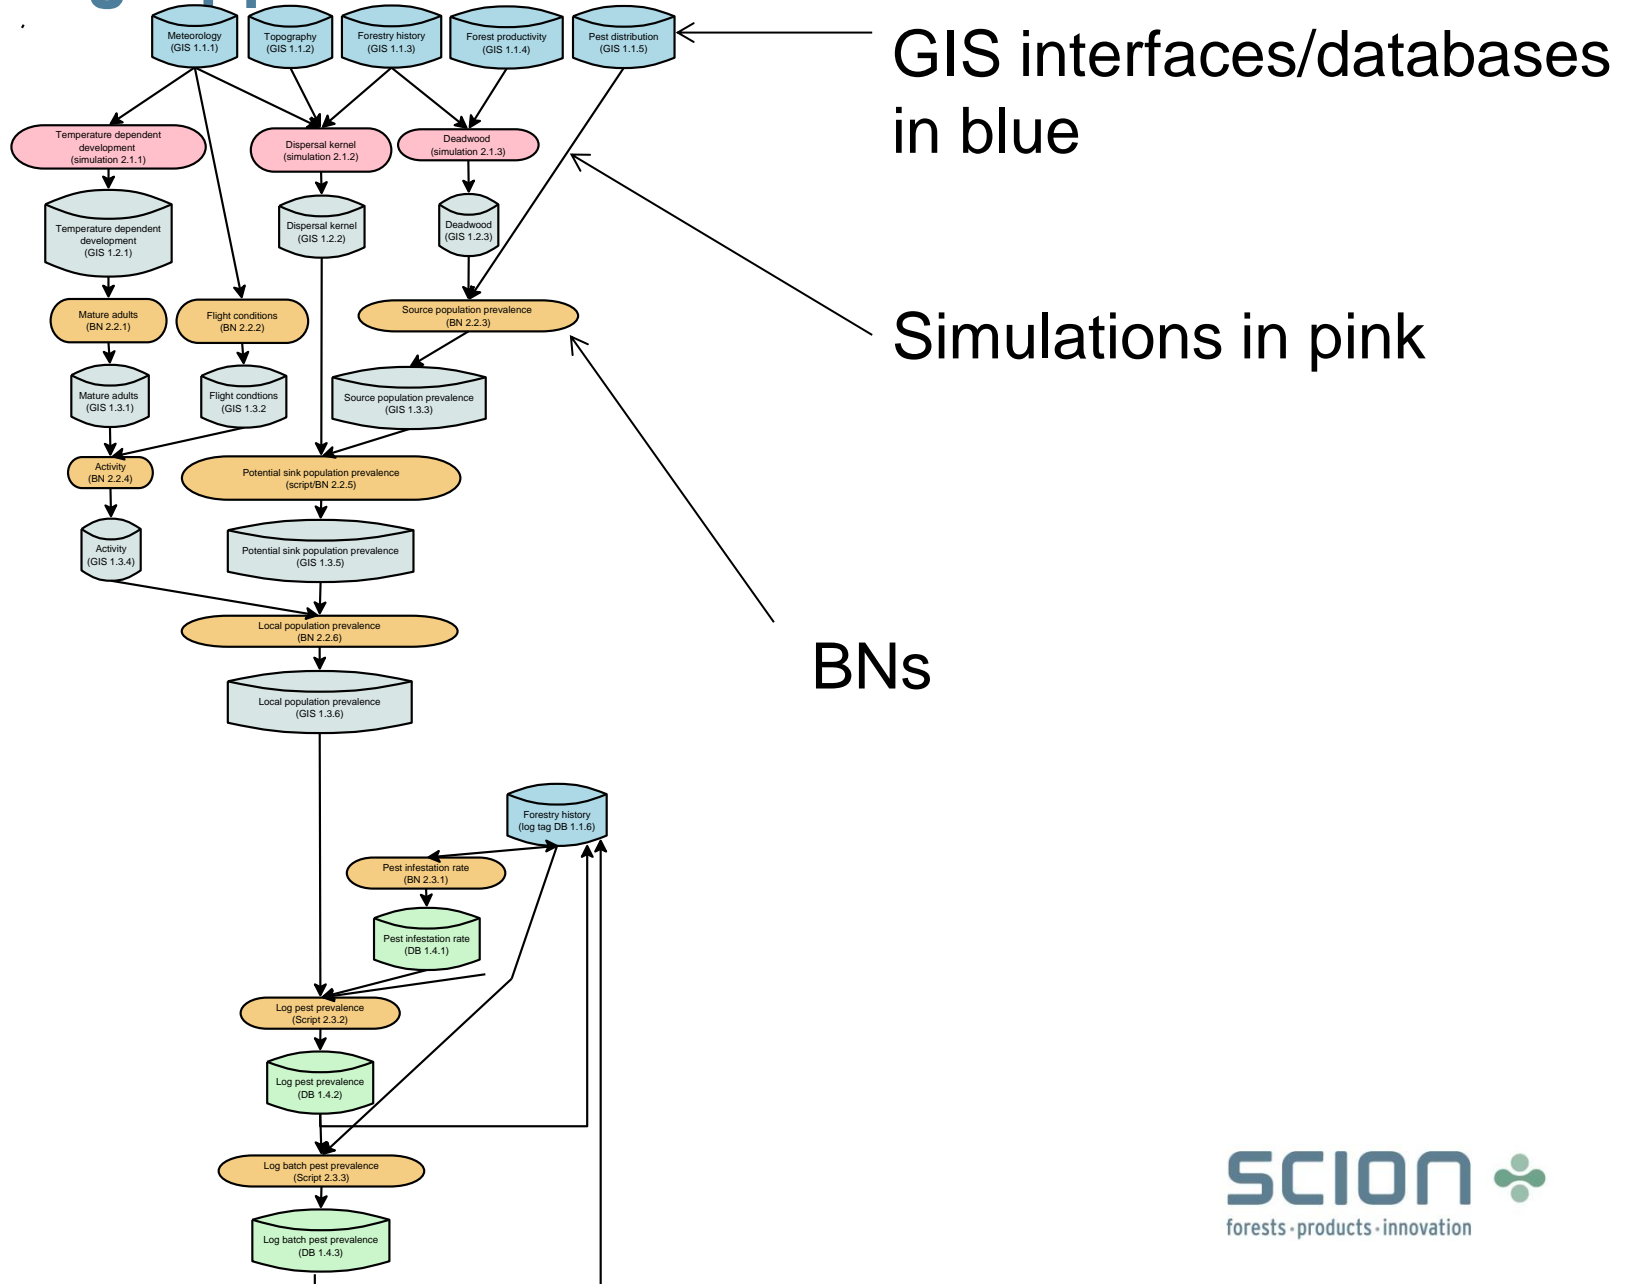

Dispersal

- How far they fly
- Conditions required for flight
- Time of day

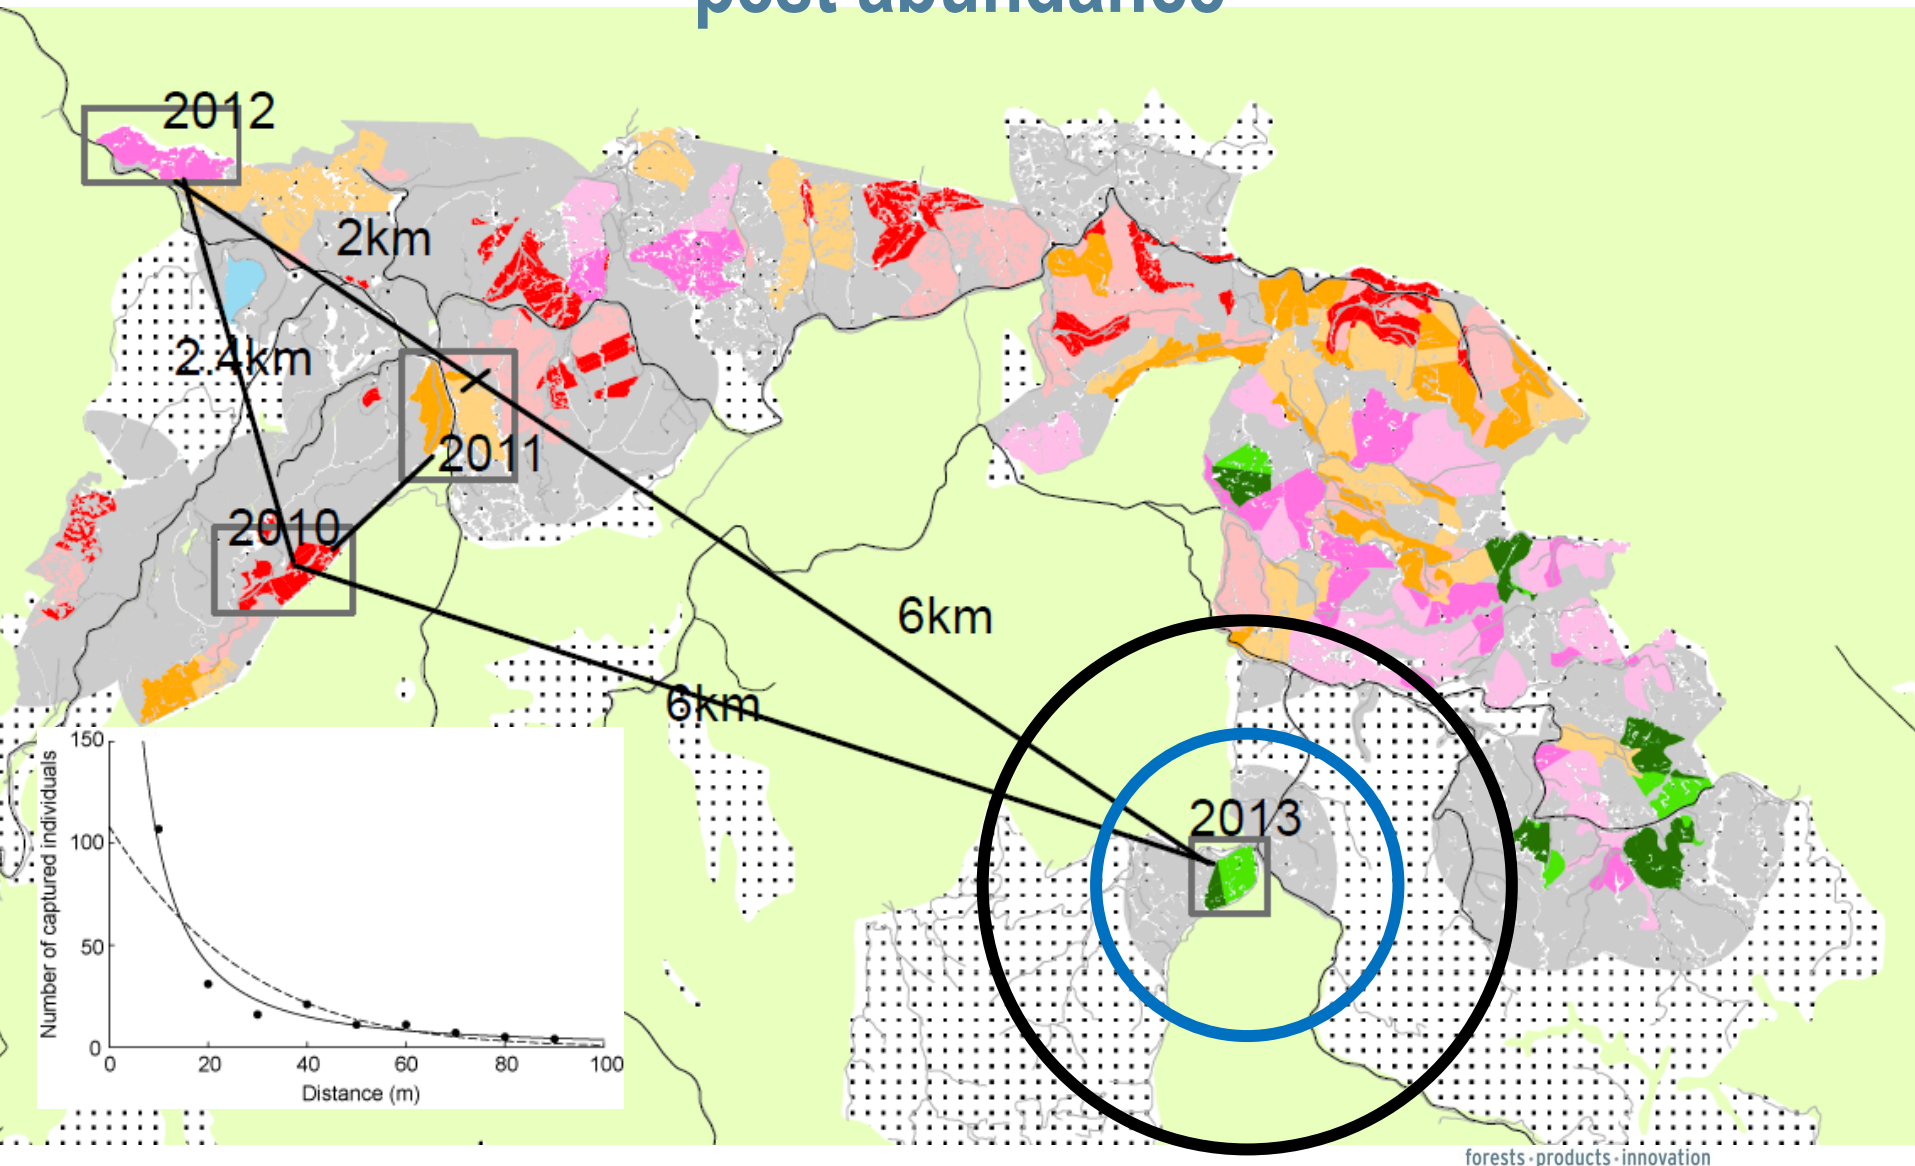

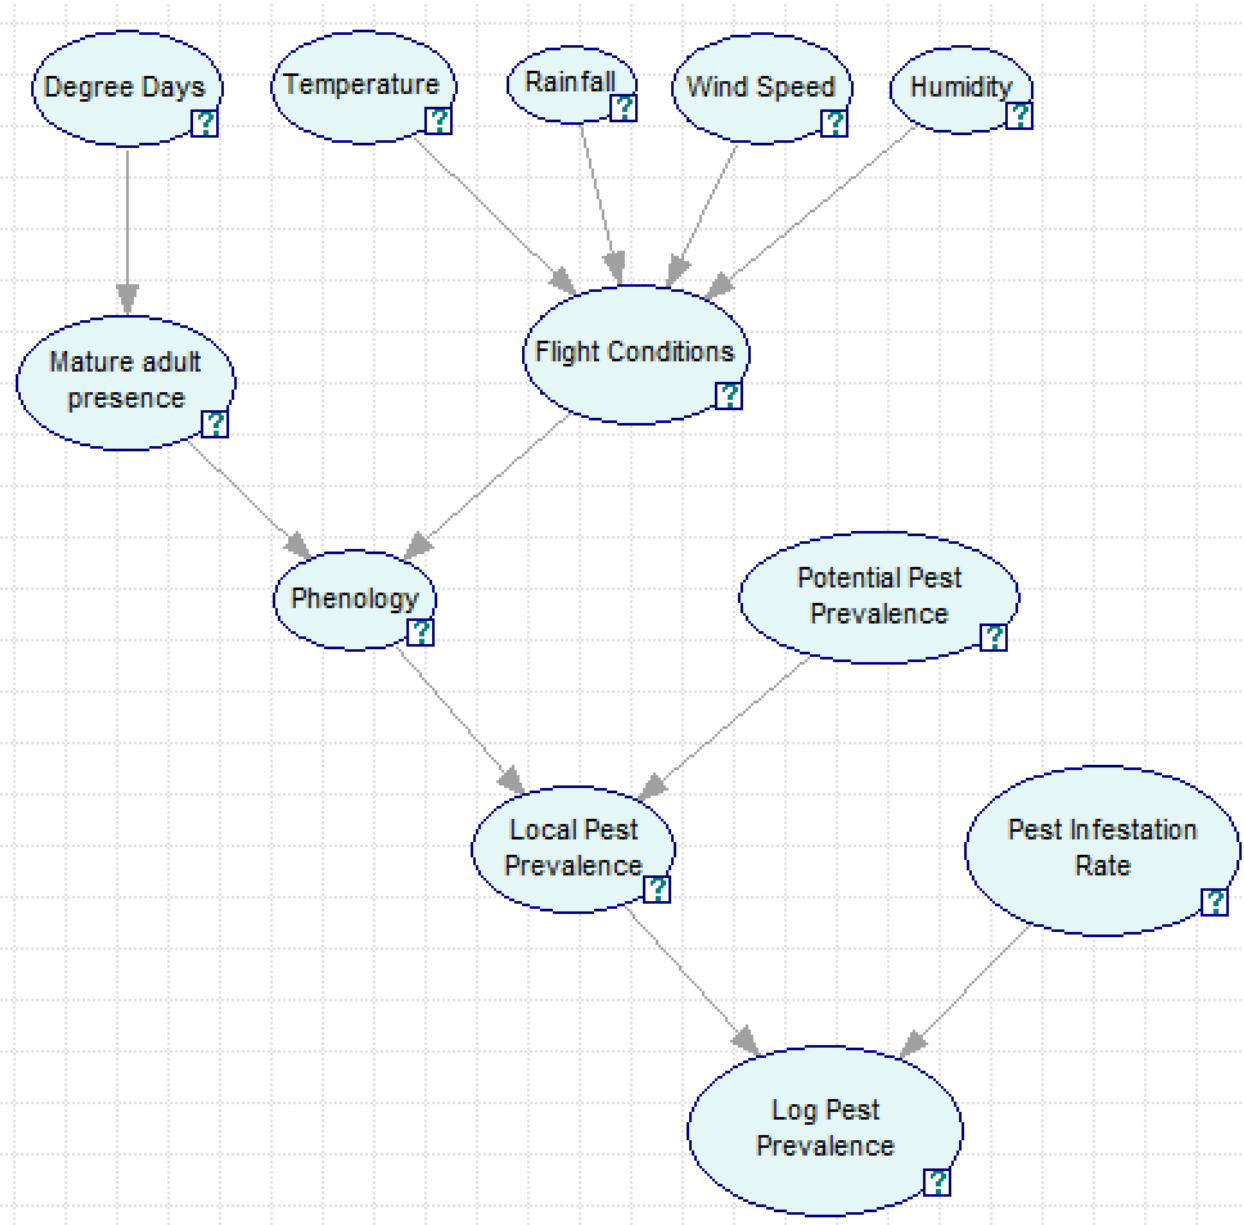

Landscape context
-Amount of plantation
-Age of source material

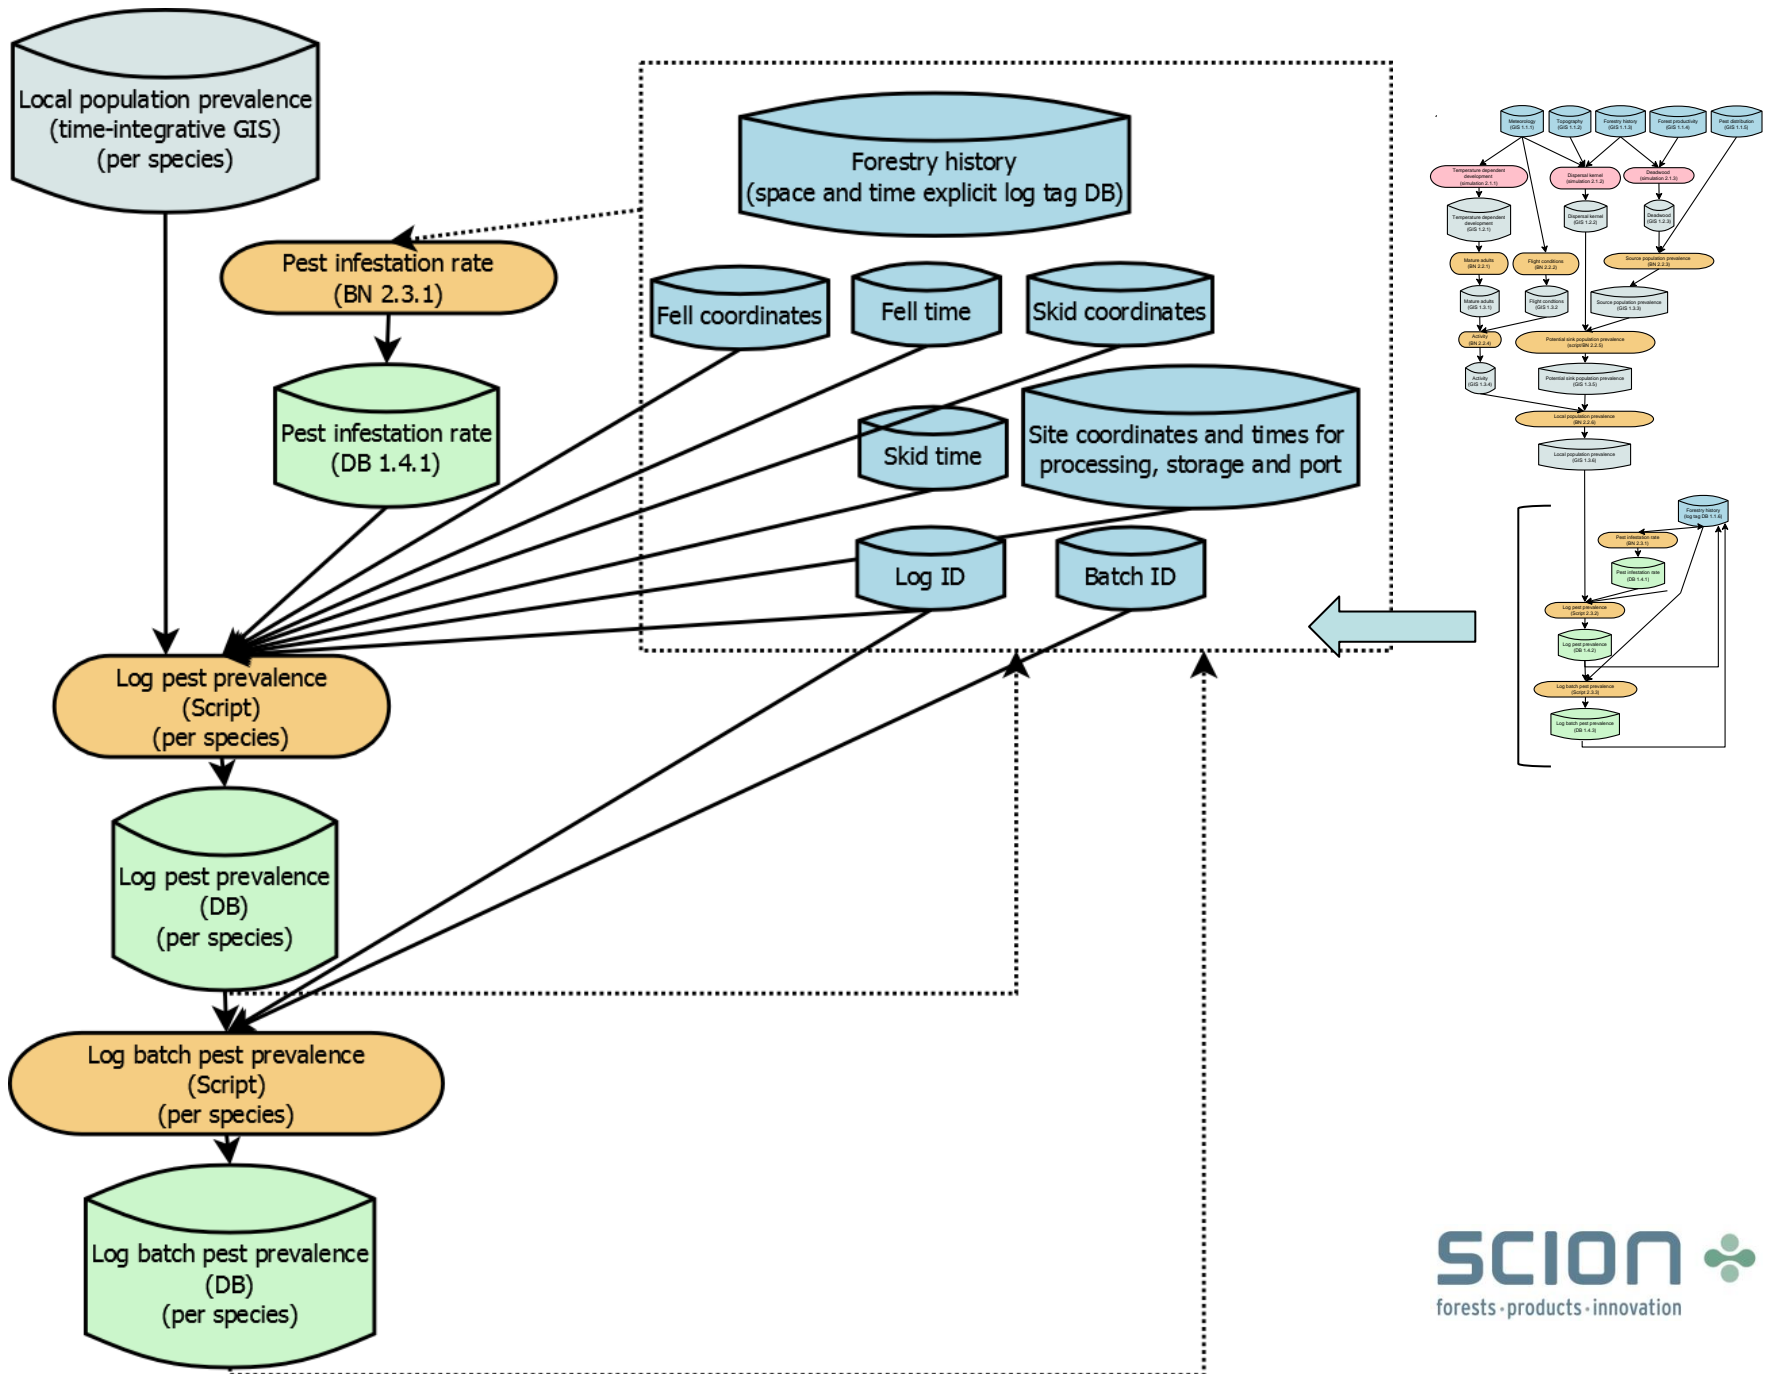

Modelling Approach

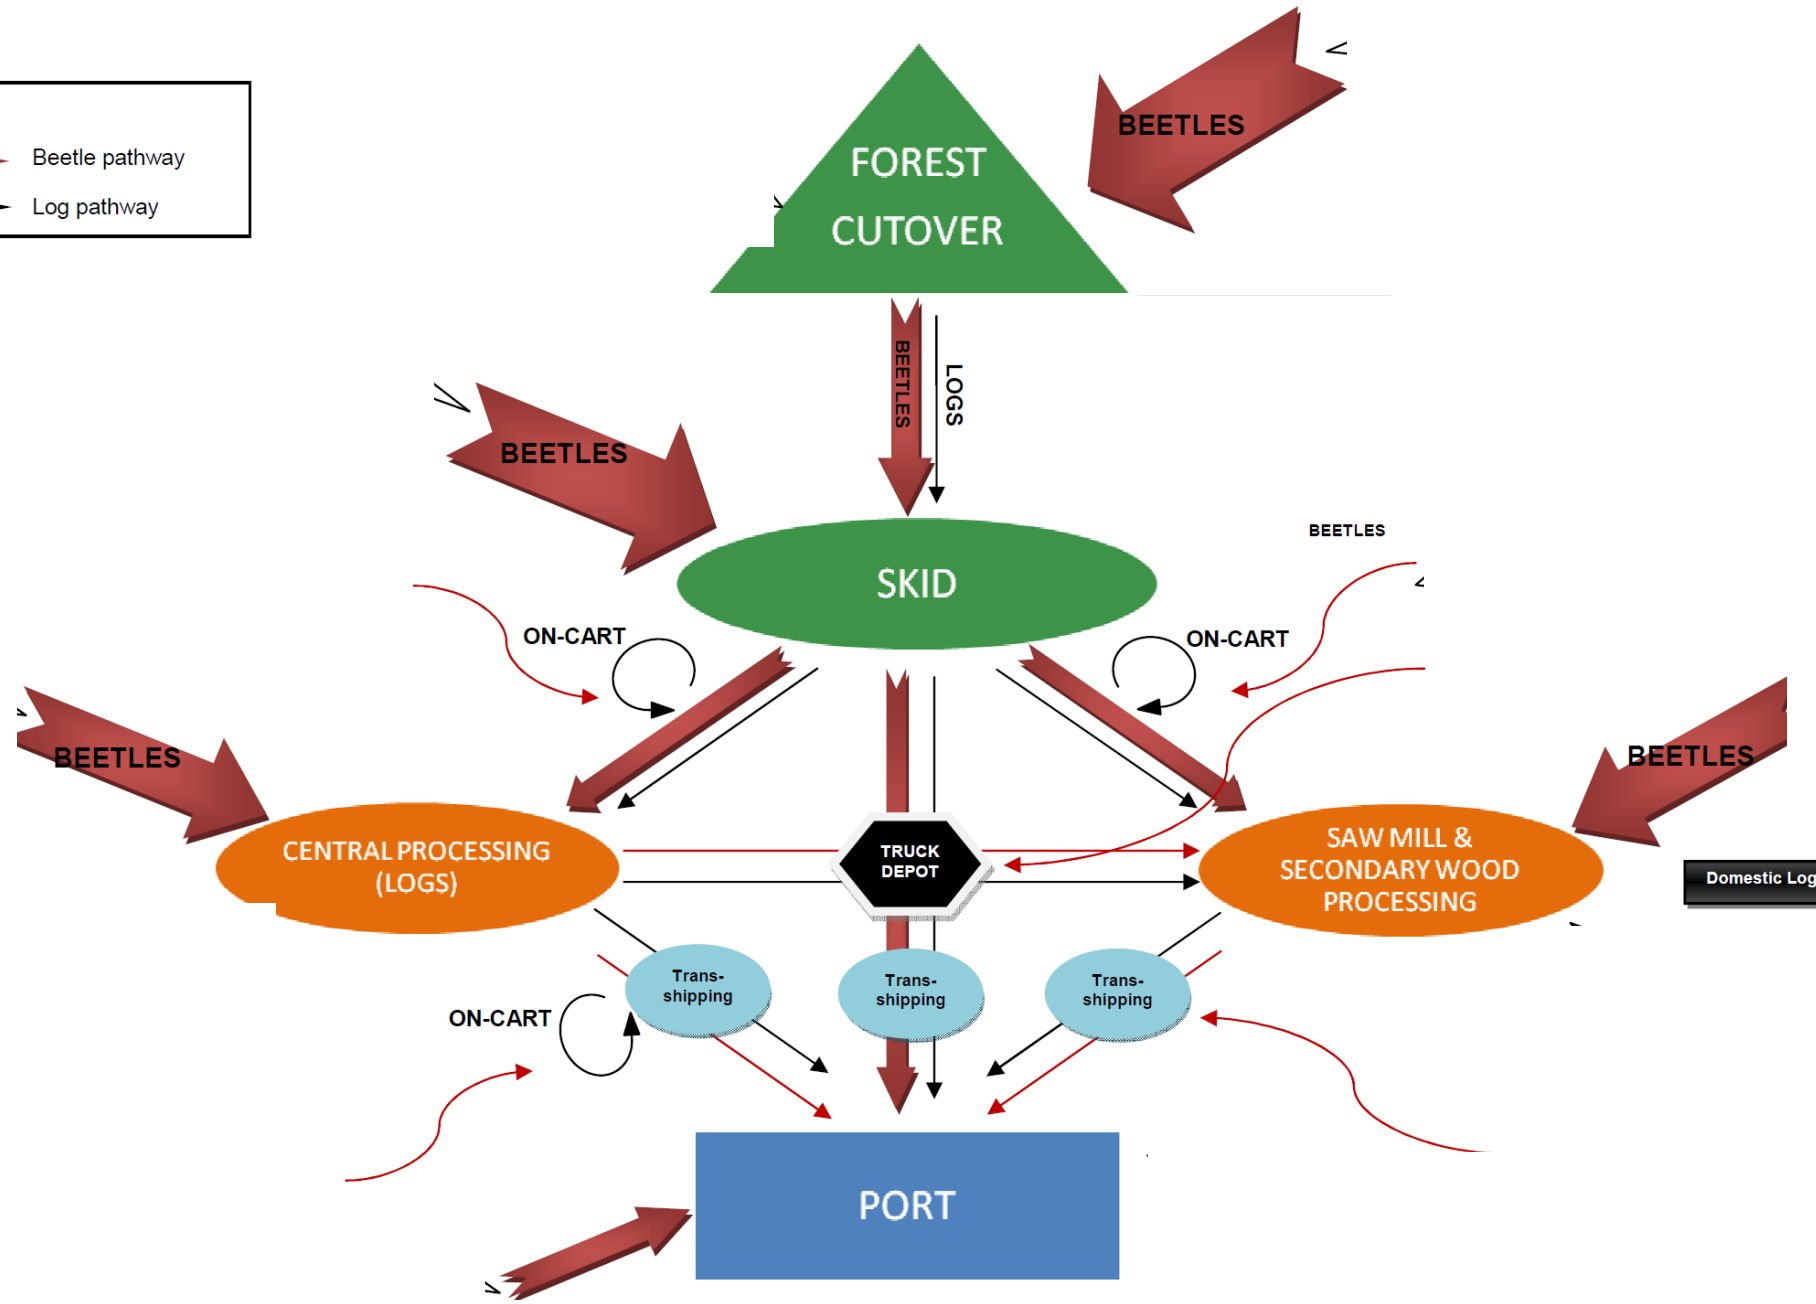

Deadwood simulation and dispersal to characterise pest abundance

How will we define dispersal kernels

Log logistics, how to track a log?

The Future

Pest complex and its distribution

Thermal development models

Landscape context
 -Amount of plantation
 -Age of source material

Pest Pressure at a given time and at a given place, e.g., Harvest area

Reduce reinfestation

- Dispersal
- How far they fly
 - Conditions required for flight
 - Time of day

Probability of infestation
 Do we treat – fumigate or heat etc

The future
